## Townsville Hospital Ensures Compliance With Raven

Raven supplied door bottom seals, perimeter seals and threshold plates for the Townsville Hospital project providing sealing systems that met a variety of sealing requirements. Raven seals were required to perform across multiple levels from the exclusion of fire, smoke and weather through to acoustic attenuation and the containment of energy.

Most projects, but particularly those in the healthcare industry require every component to meet strict regulations and standards and require certified testing to back this up. Raven's leading range of tested and certified sealing systems is why Raven sealing systems are chosen time and time again.

One of the biggest challenges for Raven on the Townsville Hospital project was accommodating the Bariatric Hoist System throughout the hospital. The rail system was installed on the ceiling passing through doorways, meaning Raven needed to deliver a sealing system to accommodate the hoist whilst ensuring a compliant and reliable performing system. Raven's extensive range coupled with its unequalled industry knowledge and expertise meant a sealing system was quickly designed in conjunction with the architect and builder to meet this requirement.
